Organometallic indicators. N. F. Dobrovolskiy. Soobshcheniya Nauk. Rabot. Vsesoyuz. Khim. Obschchestva Akademikov, 1953, No. 3, 12-17; Referat. Zhur., Khim. 1954, No. 22734.—Aniline Blue and Alkaline Blue were used for detn.  $I^-$  and  $Ag^+$ . Aniline Blue is used at  $10^{-3}$ M soln. in 50% EtOH. Near the equiv. point the suspension becomes greenish blue. The min. determinable  $I^-$  and  $Ag^+$  concns. is  $0.02N$ . The detns. can be carried out at pH 1.4-9.4 but the most favorable pH interval is 3-8.8. The presence of small quantities of  $HNO_3$  and  $NaOH$  do not interfere in the titration. In the titration of 20-25 ml.  $I^-$  with  $AgNO_3$  the quantity of indicator is 2.5-14 ml. The error of detn. is from -0.11 to -0.5%. Titration of  $Ag^+$  with KI soln. can be carried out only in artificial light. The optimum quantity of indicator is 4 ml./20 ml. of titrated soln. The error of detn. is 0.15-0.20%. Alkaline Blue is used at 0.1% soln. in 50% EtOH. The min. determinable concn. of  $I^-$  is more than  $0.015N$ . The optimum quantity of indicator per 20 ml. of titrated soln. is 4-30 ml. for 0.1N KI and 4-6 ml. for 0.05N. The pH interval is 2.1-9.3. Free  $HNO_3$  and  $NaOH$  do not interfere. For microdetn. of KI 0.3-0.5 ml. of indicator are taken for 2 ml. of titrated soln. The error of detn. is 0.3-0.6%. Titration of  $Ag^+$  with KI is reliable only in elec. light. Alkaline Blue permits detn. of  $Cl^-$  and  $I^-$  when present together. First  $I^-$  is titrated to the transition of the violet-blue color into green-blue, then the pptn. of  $Cl^-$  is finished when the soln. is entirely clear. The av. error in the detn. of  $I^-$  is up to 0.7%. M. Hesch

✓ Chlorine determinations in gastric content. M. P. Dobrovols'kiy and T. I. Mikhalevko (Med. Inst., Kharkov, Ukraine, Biokhim. Zhur. 27, 113-17 (Russian summary), 117-18 (1955).—Diphenylamine Blue is used as the indicator. It is prepd. as follows: dissolve 3 g. of the dye in 100 ml. concd.  $H_2SO_4$  (A); make soln. consisting of 3 ml. 5N  $H_2SO_4$  + 0.3 ml. 0.1N  $K_2Cr_2O_7$  (B). Add 1 drop A to B. This is the final indicator (I). Filter the gastric juice. Take 10 ml. of filtrate and add to it 0.5 g. Cl-free activated charcoal. Shake for 10-15 min. and filter. Add  $NaHCO_3$  to alk. pH. Add 0.5 ml. I to final gastric filtrate. A violet color appears. Titrate with 0.1N  $AgNO_3$ . The suspension acquires a green color. Continue titration to end point indicated by the decoloration of the ppt. and by the soln. returning to the original violet color. The method is claimed to be well suited to the needs of bacteriological and clinical labs.

Mikhaylov, Grigoriy Petrovich and Dobrovolskiy, Nikolay Sergeyevich

Svarka metallov i progress tekhniki (Metal Welding and Technological Progress) Moscow, Mashgiz, 1957. 72 p. (Series: Iz istorii mashinostroyeniya na Urale, vyp. 9) 5,000 copies printed.

Tech. Ed.: Dugina, N.A.; Editorial Board of Series: Aleksandrov, A.I., Candidate of Technical Sciences, Bogachev, I.N., Doctor of Technical Sciences, Volskov, A.A., Candidate of Historical Sciences, Dovgopol, V.I., Engineer, Kozlov, A.G., Scientific Worker, Archives Section, Sustavov, M.I., Engineer, and Yasenev, D.A., Engineer; Executive Ed. (Ural-Siberian Division, Mashgiz): Bezukladnikov, M.A., Engineer.

PURPOSE: The booklet is intended for engineers, technicians, scientific workers and students.

COVERAGE: This is the ninth of a series of ten books entitled "From the History of Machine Building in the Urals." It presents the history of the origin and development of metal welding. The

Card 1/3

Metal Welding and Technological Progress

744

historical progress of the welding industry is described with special emphasis given to electric welding. The achievements of contemporary welding practice and their applications in the Soviet national economy are discussed. The influence of welding on the progress of technology and labor productivity is also treated. Mention is made of such organizations and institutes as the Institute of Electric Welding imeni Ye. O. Paton, the Central Scientific Research Institute of Heavy Machine Building, the Institute of Welding Equipment, Uralmashzavod, the Ural Polytechnic Institute, the Krasnyy Kotel'shchik Plant in Taganrog, the Novo-Kramatorskiy Plant, the Orgametall Research Institute, etc., and their contributions are discussed briefly. Among the personalities mentioned are Professors and Doctors and Technical Sciences: G.P. Mikhaylov, N.S. Siunov, B. Ye. Paton; Engineers: A.A. Kirillov and Yu. Z. Voloshkevich, and Candidate of Technical Sciences V.V. Slepakov. There are 13 Soviet references.

SOV/137-58-7-13984

Translation from: Referativnyy zhurnal, Metallurgiya, 1958, Nr 7, p 2 (USSR)

AUTHOR: Dobrovolskiy, N. S.

TITLE: Pages from the History of the Verkh-Isetskiy Metallurgical Plant  
(1726-1861) [Iz istorii Verkh-Ietskogo metallurgicheskogo  
zavoda (1726-1861 gg.)]

PERIODICAL: Tr. Ural'skogo politekhnich. in-ta, 1957, Nr 40, pp 60-74

ABSTRACT: Data from the archives of the Verkh-Isetsk Plant are used to show the development of the forces and relationships of its production during the 18th and the first half of the 19th century (1726-1861). An attempt is made to elucidate certain questions of the history of the period when the Verkh-Isetsk Plant was operated by serf labor. In 1726 a puddling works was built, and in 1734 the first blast furnace. The cost of construction of the plant and its equipment was 10,156 rub. Prior to 1758, the plant was government property, but then it went into private hands. At the end of the 18th and during the first half of the 19th century the plant was the largest not only in the Urals but in the country. In 1800 sheet-rolling and flattening mills were built to produce roofing Fe. In 1803 a flattening machine was

Card 1/2

SOV/137-58-7-13984

Pages from the History of the Verkh-Isetsk Metallurgical Plant (cont.)

invented that made it possible to roll sheet 56"-84" long. In 1839 preheated blow was practiced at a blast furnace for the first time in the Urals. The steels were not inferior to Swedish St.

TITLE: We Have Begun to Work in Single Shifts (Nachali rabotat' v odnu smenu)

PERIODICAL: Vestnik Vysshey Shkoly, 1958, Nr 6, pp 74 - 76 (USSR)

ABSTRACT: Beginning with the 2nd semester of the 1957/58 school year, the Ural Polytechnical Institute imeni Kirov switched to one session instead of the former two. The principle problem to be solved under the new conditions was to work out a new instruction schedule. For this purpose the institute coordinated with the Moscow vuzes - the Energeticheskiy (Power Engineering) and Stanko-instrumental'nyy (Machine Tool Institutes), the Vyssheye tekhnicheskoye uchilishche (Higher Technical School), and the Leningradskiye politekhnicheskiy institut (Leningrad Polytechnical Institute) so as to profit from their experience. "Diffusion of Meteor Trails," Byul Stalinabad Astr Obs, No 1, pp 15-26, 1952

States that recent years have witnessed considerable work on the observation of stable ionization trails of meteors and particularly on the observation of the observable widening of the trails, e.g., I. S. Astapovich (Byulleten' KISO - Solar Research Commission), No 5, 6, 71, 1950, during 1942-48 in Ashkhabad made over 100 observations of stable (persistent) trails, for 80 of which the widths were evaluated, and two-sided observations of meteors are being conducted in Odessa under the guidance of Prof. V. P. Tsesevich (DAN SSSR, Vol 74, p 677, 1950), Cor.Mbr., Acad Sci Ukr SSR. Discusses variation in ionic density under the influence of turbulent diffusion; visible brightness (intensity) of the trail and turbulent diffusion; influence of light emission on ionic density; detn of the coef of diffusion according to the observable widening of the trail; evaluation of the light-emission function F; actual applications to practical examples; coef of diffusion and the so-called velocity of diffusion.

Title : Electrostatic Fields in the Heads of Comets

Periodical : Astron. zhur., v. 31, 2, 167-170, Mr - Ap 1954

Abstract : An electrostatic field in the head of a comet is computed. Principal causes of the field's origin are: 1) photoionization of the surface of the core by hard electromagnetic radiation of the sun, and 2) secondary electronic emission from the surface of the core under the action of corpuscular solar emanation. Allowance is made for the neutralization of the surface by the electronic flux from the negative space charge above the surface of the core. With equilibrium established, the intensity of the electrostatic field appears not to exceed the range of 1 volt/cm, even when the flare of solar activity is at its maximum. Such a field cannot appreciably affect the motion of dust particles and neutral molecules in the comet. This refutes L. Boss

Title : Causes of Ionization of Molecules in Comets  
Periodical : Astron. zhur., v. 31-4, 324-326, Jl-Ag 1954  
Abstract : The phenomenon of overcharging is a possible mechanism of ionization of molecules in the tails of comets of the first type. Because of the nearness of the potentials of ionization of H, CO and N<sub>2</sub>, the H<sup>+</sup> captures electrons of the neutral molecules of CO and N<sub>2</sub>, and acquires a resonant character. This possibly results in the appearance of ions CO<sup>+</sup> and H<sub>2</sub><sup>+</sup>. 8 references

DOBROVOLSKIY, O. V.

"Accelerations in the Tails of Comets 1908 III Morhouse, and 1943 I Whipple - Fedtke - Tevzadze," by O. V. Dobrovolskiy, Byul. Stalinabad. Astronom. Observ., No 12, 1955, pp 3-9 from Referativnyy Zhurnal -- Astronomiya-Geodeziya, No 2, Feb 57, Abstract No 1452)

The theory of acceleration in ionized comet tails, developed by the author (Referativnyy Zhurnal -- Astronomiya-Geodeziya, 1956, Abstract No 6400) states that the acceleration of the cloud formation in the comet's tail, produced by a corpuscular stream emanating from the sun, is directly proportional to the surface brilliance of the cloud and inversely proportional to its visible surface. Since with increasing distance from the nucleus, the cloud formations usually increase in size and their surface brightness decreases, their acceleration should decrease with the distance from the nucleus. This conclusion is verified using as an example the above-mentioned comets, for which there are sufficiently detailed acceleration determinations. The expected course of acceleration with distance from the nucleus is confirmed by observational data which, at the same time, bear out the proposed mechanism for acceleration of comet ions. (U)

AUTHOR: Dobrovolskiy, O.V.

TITLE: Radio Emission of Comets

PERIODICAL: Byul. In-ta astrofiz. AN TadzhSSR, 1958, No. 26, pp. 3 - 11

TEXT: The author discusses the results of radio observations of the comet Arend-Roland 1956h performed by various observers at frequencies from 19.7 to 1,420 Mc during the period from March 10 to May 17, 1957. The main peak of radio emission (flux up to  $5 \times 10^1$  h<sup>-22</sup>(?) w.m<sup>-2</sup>.cps<sup>-1</sup> at 27.6 Mc) is explained by generation of electromagnetic waves by plasma oscillations which arise during the interaction of ionized clouds of the cometary tails with the solar corpuscular fluxes. The simultaneous presence of a few dozens of local gas condensations with a concentration of  $\sim 10^8$  cm<sup>-3</sup> is sufficient to produce the observed flux. The existence of condensations can be understood on the basis of the ice model of the comet nucleus. According to this model, not only ejections of dust particles forming "synchrons" are probable, but also ejections of particles which are rich with

TITLE: Unsteady processes in comets and the solar activity

PERIODICAL: Referativnyy zhurnal, Astronomiya, no. 4, 1963, 68, abstract  
4.51.537 ("Tr. In-ta astrofiz. AN TadzhSSR", 1961, v. 8, 195 pp, ill.)

TEXT: This is a survey of the problem of solar activity effect on comets. General information on comets is given: peculiarities of the outer appearance, statistical data, description of comet spectra with tables of wavelengths, methods and results of comet mass determinations from photometric data, differentiation of matter in comet atmospheres, models of comet nuclei, description of comet flares. The results of empirical studies of phenomena relations in comets and on the Sun are described; they include the main information on corpuscular fluxes and intensity of short-wave solar emission from rocket and other data; description of methods for statistical correlations of solar and cometary phenomena, with examples analyzed in detail; summary of results cover the studies up to 1959 inclusive (50 appearances of comets). It has been found

Card 1/2

S/269/63/000/004/024/030

Unsteady processes in comets and the solar activity A001/A101

that many comets do not reveal a relation sought for, or show indefinite results; however, more than 50% appearances indicate the existence of a direct relation between the level of comet activity and solar activity. The effect of short-wave radiation of the Sun on comets is calculated, in particular it is shown that its intensity is insufficient to explain the ionization of cometary atmospheres. A more detailed consideration is given to the theory of action of solar corpuscular fluxes on the nucleus, neutral coma and the ionic component of cometary atmospheres. The following parts of a comet are considered separately: a) Nucleus. Electrization, cathode disintegration, heating and chemical transformation in the nucleus surface layer are calculated. It is shown that only the latter effect may turn out to be efficient, provided that the chemical composition of the nucleus is suitable. b) Neutral coma. The heating of coma as a result of elastic scattering of solar protons is considered. The most important inelastic processes: dissociation, charge exchange, ionization, are considered. c) Ionic component. The fundamentals of the Alfvén magnetohydrodynamics of comets are presented. The studies by L. Biermann and the author on the theory of acceleration and the theory of contracting shells of Morehouse-type comets are expounded. It is emphasized that the further development of electromagnetic theory of comets has a good prospect. There are 333 references.

TOPIC TAGS: astrophysics, comet

SUB CODE: 03

ABSTRACT:

One of the least clear problems in cometary physics is the mechanism of ejection of the particles forming cometary tails and heads from cometary nuclei. For solution of this problem it is very important to find the dependence between acceleration  $a$  and the initial velocity  $v_0$  of particles of the cometary atmosphere. Such a dependence could serve as an indication of what ejection mechanism is most probable. The author has analyzed data for  $a_0$  and  $v_0$  for a number of cometary formations. The table and figure accompanying the text show that there is a very clearly expressed quadratic dependence between  $a_0$  and  $v_0$ :  $a_0 = \text{const } v_0^2$ .

Card 1/2

ACC NR: AP7013142

This dependence is correct in a very wide range of  $a_0$  and  $v_0$ . The paper clearly establishes that the accelerations of the dust particles of cometary atmospheres are proportional to the squares of their initial velocities relative to the cometary nucleus. Orig. art. has: 1 figure, 1 formula and 1 table. [JPRS: 40,106]

TITLE: A device for stopping an airplane after landing. Class 62, No. 184154

SOURCE: Izobret prom obraz tov zn, no. 15, 1966, 197

TOPIC TAGS: aircraft landing system, airfield auxiliary equipment

ABSTRACT: This Author Certificate presents a device for stopping an airplane after its landing on a runway. The device includes a cable system consisting of braking parts and a receiving part of the cable with cable holders, two braking drums with frictional disk brakes and with conical clutches, a regulator for winding and stretching the braking cable, and pneumo(hydro)electrical systems for directing the work of the device. To lower the dynamic loads at the moment of contact of the airplane and the receiving cable, the device is provided with block-and-tackle absorbers. The casings of these absorbers contain rigidly fixed blocks and movable block carriers tied to the casing with elastic bands.

"Dok Ak Nauk SSSR" Vol LXXIII, No 1, pp 63-65

Certain organic substances [unnamed] have mechanical  
and optical properties suitable for model photoplas-  
tic studies of various phenomena observed in the  
working of metals. Nine colored photoplastic photo-  
graphs show model pressing and extrusion processes.  
Submitted 8 Mar 50.

"Studying Isochromatic Lines in Transparent Models  
Obtaining Residual Plastic Deformations," S. I.  
Gubkin, Active Mem, Acad Sci BSSR; S. I. Dobrovolsky

DAN SSSR, Vol 88, No 5, pp 799-802

Discusses results obtained by pressing flat punch  
into models made of 4 various transparent mate-  
rials which reveal optical sensitivity under load.  
Classifies these materials, in regard to their  
response to loading, in following groups: elastic,

258T50

elastic-plastic, plastic, and high-plastic mate-  
rial. Concludes that distribution of stresses in  
polycrystalline metals during their plastic defor-  
mation may be studied on transparent models of  
amorphous high-plastic bodies which show stress  
distribution in conformity with the laws of  
plasticity. Illustrations show isochromatic  
lines in models of various materials.

Title : Optical modeling

Periodical : Priroda 43/4, 77-80, Apr 1954

Abstract : A study is made of strains and stresses in the working of metals by rolling, stamping, drawing, extruding, etc. Two ways of studying strains are indicated: Mathematical calculation and the use of models. Halide salts of silver and thallium were used for making models because they have a crystalline structure similar to that of metals and are transparent. With the use of different mixtures of these materials, models were made and the lines indicating the strains were studied photographically. Four Russian references (1949-1952). Drawings.
